Project 2 Reflection

Programming for Design

The aim of this project is to build a website that displays information about books. We have provided two js files, html file as well as css file to run our program. On the other hand we are providing pseudocode and flowcharts.

My project partner and I got together to achieve the aim of this project. We have looked at week 12 material and benefited from that to go ahead with our project.

The flowcharts explain how the website is running and who was created. It provide good information of steps to take in order to achieve with last result.

After doing this project I have understood better how this website works and runs, as well as how to use flowcharts more effectively than before.

I tried to keep the flowcharts simpler with enough details about the books' website. Flowcharts were edited couple of times and tried to fit all in one page for easier screening.

I was expecting more time would take in order for us to achieve the aim of the project but things were simpler as I worked through it.

We have used the two isbn numbers provided in lectures, however the outline and appearance of the website looked very good after including css file in the program.

After all, I am very glad to finish this subject with such a knowledge in programming which I had probably zero knowledge at.
